Copyright Robert van Engelen, Florida State University, 2005

Syllabus

- Prerequisites: COP4020
- Textbook: "*Compilers: Principles, Techniques, and Tools*" by Aho, Sethi, and Ullman
- Other material: "*The Java™ Virtual Machine Specification*", 2nd edition and class handouts
- Four exams (60%) and continuous programming assignments (40%)
- For more up-to-date info: http://www.cs.fsu.edu/~engelen/courses/COP5621

Assignments and Schedule

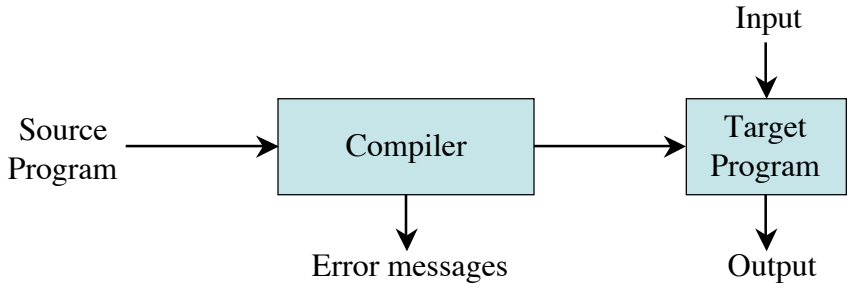
http://www.cs.fsu.edu/~engelen/courses/COP5621/assign.html

Objectives

- Know how to build a compiler for a (simplified) (programming) language
- Know how to use compiler construction tools, such as generators for scanners and parsers
- Be familiar with virtual machines, such as the JVM and Java bytecode
- Be able to write LL(1), LR(1), and LALR(1) grammars (for new languages)
- Be familiar with compiler analysis and optimization techniques
- … learn how to work on a larger software project!

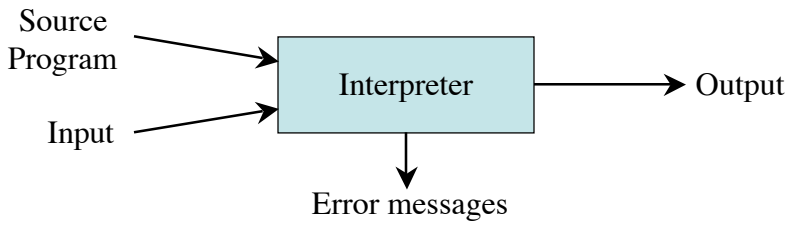
Compilers and Interpreters

- "*Compilation*"
  - Translation of a program written in a source language into a semantically equivalent program written in a target language



Compilers and Interpreters (cont'd)

- "*Interpretation*"
  - Performing the operations implied by the source program



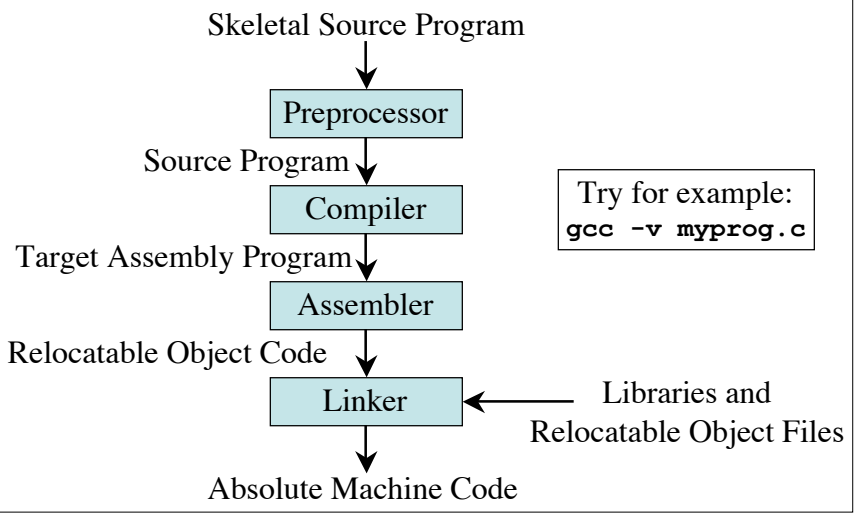
The Analysis-Synthesis Model of Compilation

- There are two parts to compilation:
  - *Analysis* determines the operations implied by the source program which are recorded in a tree structure
  - *Synthesis* takes the tree structure and translates the operations therein into the target program

Other Tools that Use the Analysis-Synthesis Model

- *Editors* (syntax highlighting)
- *Pretty printers* (e.g. doxygen)
- *Static checkers* (e.g. lint and splint)
- *Interpreters*
- *Text formatters* (e.g. TeX and LaTeX)
- *Silicon compilers* (e.g. VHDL)
- *Query interpreters/compilers* (Databases)

Preprocessors, Compilers, Assemblers, and Linkers



The Phases of a Compiler

Phase	Output	Sample
Programmer	Source string	`A=B+C;`
Scanner (performs *lexical analysis*)	Token string	`'A', '=', 'B', '+', 'C', ';'` And *symbol table* for identifiers
Parser (performs *syntax analysis* based on the grammar of the programming language)	Parse tree or abstract syntax tree	Semantic analyzer (type checking, etc)	Parse tree or abstract syntax tree	

Intermediate code generator	Three-address code, quads, or RTL	`int2fp B t1`
		`+ t1 C t2`
		`:= t2 A`

Optimizer	Three-address code, quads, or RTL	`int2fp B t1` `+ t1 #2.3 A`

Code generator	Assembly code	`MOVF #2.3,r1`
		`ADDF2 r1,r2`
		`MOVF r2,A`

Peephole optimizer	Assembly code	`ADDF2 #2.3,r2` `MOVF r2,A`

The Grouping of Phases

- Compiler front and back ends:
  - Analysis (*machine independent* front end)
  - Synthesis (*machine dependent* back end)
- Passes
  - A collection of phases may be repeated only once (*single pass*) or multiple times (*multi pass*)
  - Single pass: usually requires everything to be defined before being used in source program
  - Multi pass: compiler may have to keep entire program representation in memory

Compiler-Construction Tools

- Software development tools are available to implement one or more compiler phases
  - *Scanner generators*
  - *Parser generators*
  - *Syntax-directed translation engines*
  - *Automatic code generators*
  - *Data-flow engines*

Outline

- Ch. 1: Introduction
- Ch. 2: A simple One-Pass Compiler for the JVM
- Ch. 3: Lexical Analysis and Lex/Flex
- Ch. 4: Syntax Analysis and Yacc/Bison
- Ch. 5: Syntax-Directed Translation
- Ch. 6: Type Checking
- Ch. 7: Run-Time Environments
- Ch. 8: Intermediate Code Generation
- Ch. 9: Code Generation
- Ch.10: Code Optimization
